Acid Rain

Acid rain encompasses both wet (rain, snow, fog) and dry (particulate) acidic depositions that occur near and downwind of areas where major emissions of sulfur dioxide (SO$_2$) and nitrogen oxides (NOx) result from burning fossil fuels.

Acid rain is defined as precipitation in which $\text{pH}$ below 5.6

Renewable Energy

The renewable sources are solar energy, water (hydro) power, wind power and energy derived from biomass.

Non – Renewable Energy

Fossil fuel
